## **IMPORTANT:**

## Waterproof Seal

- 1. Make sure the silicone seal is properly in position.
- 2. Tighten ALL screws fully. Then <u>GO</u> <u>BACK and double check **EACH** screw</u> <u>is fully tightened.</u>

**NOTE:** When the screws are fully tightened, the silicone pad will be squeezed and protruding on all sides.

Not fully tightening a screw may result in a small air gap, causing air to come inside and condense into water.

## To ensure the light is waterproof, you must make sure it is FULLY AIR-PROOF.
